### Burndown Chart :

### Explanation:

In this sprint 3, we mostly focused on working with user stories related to improving UIs and adding new user profiles as mentioned in sprint3.md, which a lot of them required learning new ideas and some research, hence our velocity from the start to middle of this sprint was not as fast as ideally recommended but this is expected as the research needed quite a time.

Around the middle of the project, we noticed there needs to be several bug fixes due to new technologies we adopted such as fragment in UI, hence we added several bug fixes such as task153 on jira which led to an increase in overall story points of this sprint as seen in the burndown chart.

Toward the end of the project, our hard work of research and getting comfortable with using new technologies such as fragment in UI finally paid off, and as a result, this familiarity with new technologies led to an increase in velocity and we finished overall tasks as expected.
